Objective

Growing IT specialist with a background in economics and finance, driven by curiosity and passion for backend and web technologies. Constantly seeking to expand knowledge and dive deeper into the world of software development to become a strong and versatile full-stack professional.

Skills

Languages & Technologies:

• Java, MySQL

• REST APIs

Tools & Environments:

• Git & GitHub

• Docker (basic usage with Image SQL)

• Postman

AI Development Tools:

• Claude Code — extensive experience with agentic coding workflows and MCP integrations

• Antigravity (Google) — familiar with agent modes, strict mode, and security considerations

• Void & Cursor — experience with AI-assisted code editing and multi-file refactoring

Projects

Client-Service Manager

It is a backend application built with **Java** and **Spring Boot** to manage client interactions and service workflows.

- ⚙ **Structured architecture** — uses Spring Boot and MySQL for scalability and clean organization.
- **Client management** — supports user roles, service tracking, and request handling.
- **Ready for expansion** — designed to evolve into a full-stack system with real-world applications.

Student Course Enrollment

One of my last projects that I was working on and finished it not too long ago.

A backend application built with Java and Spring Boot for managing students, courses, teachers, and

enrollments.

- ⚙ **Clean modular architecture** — utilizes Spring Boot, JPA, and MySQL with structured layers (Controller, Service, Repository, DTOs, Mappers).
- 🧠 **Academic domain logic** — handles course creation, student management, teacher assignments, and enrollment workflows.
- 🚀 **Built for real scalability** — designed so features can expand into a full educational platform with authentication, scheduling, and UI integration.

Task Manager – Workflow Engine

🔨 **In Development** — actively being built, no final release yet.

A high-performance, programmable workflow automation engine built with Java 21 and Spring Boot. Allows defining complex business logic as structured JSON workflows with support for dynamic HTTP calls, cron scheduling, webhook triggers, and JavaScript transformations via GraalVM Polyglot. The most technically detailed project to date, featuring a custom execution engine, immutable versioning, and a clean modular architecture.

- ⚙ Extensible task system — supports HTTP_CALL, LOG, EMAIL, and TRANSFORM task types out of the box.
- 📜 Scriptable logic — embedded JavaScript execution via GraalVM Polyglot for data transformation between workflow steps.
- 🔄 Immutable versioning — draft/publish lifecycle ensures production stability across workflow versions.
- ⏰ Intelligent scheduling — native cron expression support and webhook triggers for instant execution.
- 🛡 Built-in resilience — configurable retry policies and failure modes per step.
- 🗄 JSONB-powered — leverages PostgreSQL JSONB for flexible and performant workflow definitions.

Tech stack: Java 21 • Spring Boot 3.4.3 • PostgreSQL + Flyway • GraalVM Polyglot (JS) • OpenFeign • MapStruct • Lombok

Education

Georgian Technical University – Tbilisi, Georgia Computer Science Undergraduate, started my course at September 2024.
